

DrakoSanctis it is, now you can generate the package id with this as the company name and AurigaNavi as the app name

Domain name/ package ID: com.drakosanctis.apps.auriganavi

PostgreSQL password: mikerr

Android keystone.

<https://auriga-navi-1--michaelomosh118.replit.app>

<https://auriga-navi-1--michaelomosh118.replit.app/>

Graphics aim:

ok my goal is to use the dragon in such a way that it comes from a constellation of draco then flies around in curls(a night starry sky) upto another constellation of auriga which comes to life after a glow(dragon blesses it) and then the person on the screen, the caretaker of the sheep that nurtured zeus, is the one who issues voice announcements when the app user is looking for something while the sheep bleats (phone vibrates) when a wall is nearby and the whole time, the dragon's parts are at the top, bottom and sides of the screen with it rotating once the user sets priorities like looking for something in the environment but stops rotating and curls up into the screen, eventually covering it with its head in the middle of the screen when the user is setting new objects to find or is not actively using app/ presses a button

Full-Stack Object Detection & Tracking Application

Project Overview

Build a real-time object detection and tracking web application using computer vision. Users can maintain a list of target objects to find, and the app detects them via webcam feed, providing bearing (angular direction) and distance estimates with text-to-speech audio cues.

Core Features

1. **Live Webcam Detection** - Real-time object detection using TensorFlow's COCO-SSD model
2. **Target Management** - Users can add/remove objects from a tracking watchlist (from 80+ COCO-SSD class names)
3. **Bearing & Distance Calculation** - Mathematical calculation of object position (degrees from center) and estimated distance
4. **Text-to-Speech Feedback** - Audio alerts when tracked objects are detected ("cup detected, 15 degrees right")
5. **HUD Overlay** - Bounding boxes and visual cues overlaid on camera feed
6. **Target List View** - Management interface to add/remove tracked objects with custom descriptions
7. **Last Seen Tracking** - Records timestamp of last object detection

Tech Stack

- **Frontend:** React 18 with Vite, TypeScript, TailwindCSS, shadcn/ui components
- **Backend:** Express.js with PostgreSQL/Drizzle ORM
- **ML:** TensorFlow.js with COCO-SSD model

- **Video:** react-webcam
- **Forms:** react-hook-form with Zod validation
- **Data Fetching:** TanStack React Query v5
- **Routing:** wouter
- **UI Components:** 40+ shadcn/ui components (buttons, dialogs, cards, etc.)

Database Schema

targetItems table:

- id (serial, primary key)
- name (text, not null) - COCO-SSD class name (e.g., "cup", "person")
- description (text) - User's custom description
- isFound (boolean, default false)
- lastSeenAt (timestamp)
- lastLocation (jsonb) - Store {degrees, distance}

Based on the themes of the AFB February 2025 report ("Empowering or Excluding: Expert Insights on Inclusive AI"), your app's focus on object distance and high-accuracy coordinates aligns perfectly with several key priorities the AFB has identified for "Human-Centered Autonomy."

While the report doesn't mention your specific app by name, it provides a "checklist" for what solves the problem of true independence versus what is just a "cool gadget." Here is how your tech maps to their 2025 findings:

1. High-Accuracy Coordinates = "Curb-to-Door" Independence

The AFB report emphasizes that the biggest failure in current transit (like Uber or standard GPS) is the "Final Fifty Feet." * The Problem: Standard GPS is accurate to about 15–30 feet, which is the difference between standing in front of a door or standing in the middle of a busy street.

* Your Solution: By providing high-accuracy coordinates, you are solving the specific "orientation" problem that allows a user to find a specific entrance or a bus stop pole without asking a bystander. This directly addresses the "Self-Reliance" goal.

2. Object Distance = "Safety Without Sanity-Check"

The report discusses the "cognitive load" of being visually impaired in a city.

* The Problem: Many apps tell you what an object is (e.g., "Parked car"), but not where it is in relation to your body. This forces the user to rely on their cane or a sighted person to avoid a collision.

* Your Solution: By outlining precise distance, you allow the user to build a mental map of the environment in real-time. This shifts the user from being a "passive passenger" to an "active navigator."

3. The "AI Bias" Hurdle (What the Report Warns About)

The AFB report warns that AI often fails to recognize non-standard obstacles (like a guide dog, a white cane, or a person in a wheelchair).

* Does your app solve this? If your object detection is "high accuracy" enough to distinguish between a "moving pedestrian" and a "stationary signpost" at specific distances, you are overcoming the AI Bias the AFB is worried about.

How to frame this to Stephanie Enyart:

When you talk to her, don't just say "my app shows distance." Use the language from her report to prove it solves the problem:

> "In the February report, you mentioned the need for AI to be a 'catalyst for inclusion.' My app addresses this by providing high-accuracy spatial coordinates and object distance. This eliminates the 'Final Fifty Feet' gap and allows for total independence by removing the need for a sighted 'human-in-the-loop' to verify the environment."

≥

Comparison: Is it a "Real Solution"?

| Feature | Does it solve the AFB "Empowerment" standard? |

|---|---|

| Object Labeling (e.g., "This is a chair") | Partially. It's helpful, but doesn't allow movement. |

| Object Distance | Yes. This allows for safe, autonomous pathfinding. |

| Standard GPS | No. Too much margin for error in urban "canyons." |

| High-Accuracy Coordinates | Yes. This is the "Holy Grail" of curb-to-door navigation. |

Would you like me to help you draft a specific "Technical Brief" paragraph you can include in your email to Stephanie that explains exactly how your accuracy levels meet the AFB standards?
